Result 1 (real box value). [Type expressions, explicit carrier specimen]
Let x be a real number. Then

$$\text{real box}(x).\text{value} = x.$$

Result 2 (function box value). [Type expressions, inferred compound carrier specimen]
Let f be a function assigning to each $k : \mathbb{N}$ a value of type $\mathbb{R}^k$. Let g be a function assigning to each $k : \mathbb{N}$ a value of type $\mathbb{R}^k$. Assume $\text{box}(f) = \text{box}_{\prod_{k:\mathbb{N}} \mathbb{R}^k}(g)$ (`same`). Then

$$f = g.$$

Result 3 (vector box value). [Type expressions, indexed carrier specimen]
Let n be a natural number. Let v be a vector of length n over $\mathbb{R}$. Then

$$\text{vector box}(n, v).\text{value} = v.$$

LLM-assisted language specimens and proofs (gpt-6, 2026-11-07). See PROVENANCE.md. These statements validate explicit type arguments.
